Fullstack (.NET + React) Engineer (LLM • AI-Assisted Dev)

Skill Highlights

- **Languages:** C#, SQL, TypeScript, JavaScript
- **Backend:** .NET 8/9/10, ASP.NET Core, Web API, Minimal APIs, Entity Framework Core
- **Frontend:** React, TypeScript, MUI, Razor, jQuery
- **Architecture:** Microservices, REST APIs, Clean Architecture, SOLID, CQRS, Dapr, event-driven architecture, RabbitMQ
- **Data & Cloud:** SQL Server, MySQL, Redis; Google Cloud, Docker, CI/CD (GitHub Actions), Terraform
- **LLM Integration:** OpenRouter (multi-model), chat completions API, structured JSON outputs, schema validation & fallbacks
- **Prompt Engineering:** system/user separation, few-shot, temperature 0, structured output, anti-hallucination guardrails
- **AI-Assisted Development:** Cursor, OpenCode, Graphify (code knowledge graph), Archify, ui-ux-pro-max
- **Testing & Observability:** xUnit / NUnit, integration testing; Serilog, OpenTelemetry, Grafana

Languages

English - B2

Fullstack (.NET + React) Engineer with 7+ years of commercial experience building scalable backend systems, APIs, and web products.

Strong in modern **.NET (8/9/10), React, microservices**, and cloud solutions (**GCP**), now focused on shipping **LLM-powered features** into production.

Applies **prompt engineering, structured outputs, and AI-assisted development** to deliver faster without sacrificing reliability. Comfortable taking end-to-end ownership of features and contributing to architecture decisions in international teams.

Experience

Senior Software Engineer Aug 2021 - Present

Elinext | Remote

Tech stack: .NET 8/10, ASP.NET Core Web API, React, TypeScript, SQL Server, Redis, Google Cloud, .NET Framework 4.8, Microservices, event-driven, RabbitMQ, OpenRouter

- Designed and delivered **scalable backend services** using .NET for enterprise applications
- Built and maintained **RESTful APIs** for internal and customer-facing systems
- Contributed to **architecture design** and technical decision-making for new system components
- Took **ownership of full-stack features** from design to production release
- Developed React-based dashboards and internal tools for system monitoring and operational workflows
- Modernized legacy modules from **.NET Framework to .NET Core / .NET 8+**, improving maintainability
- Integrated **LLM-powered features** (OpenRouter) with **structured JSON outputs** and schema validation
- Applied **prompt engineering** with system/user separation, temperature control, and anti-hallucination guardrails
- Improved performance using **Redis caching** and optimized database queries
- Ensured reliability of **production systems** with real users and business-critical workflows
- Mentored developers, conducted **code reviews**, and collaborated with product, QA, and frontend teams in Agile environment

Impact highlights:

- Reduced manual operational work via internal automation tools
- Accelerated feature delivery through reusable backend components and AI-assisted workflows
- Delivered responsive, mobile-first UI/UX across multiple products

.NET Developer Nov 2019 - Jan 2021

KSD | Delivery | Minsk

Tech stack: ASP.NET Core, WebForms, MySQL, jQuery, Bootstrap

- Improved performance and stability of an existing business web platform
- Integrated ASP.NET Core services into legacy system architecture
- Enhanced UI behavior using AJAX and frontend scripting
- Worked with Entity Framework and MySQL for data access and optimization
- Supported gradual transition from monolithic legacy components

.NET Developer Feb 2019 - Feb 2020

TESIB | Remote (Czech Republic)

Tech stack: ASP.NET WebForms, SQL Server, jQuery

- Maintained and enhanced legacy enterprise applications
- Improved existing workflows and resolved production issues
- Worked with SQL Server for backend logic and performance tuning
- Delivered features and bug fixes in collaboration with distributed team

Self Projects

Studhub

.NET 10, ASP.NET Core Web API, EF Core, React 18, TypeScript, MUI, SQL Server, Tesseract OCR, Telegram API, JWT, Serilog, RabbitMQ, Dapr, event-driven architecture, microservices

- Source code: github.com/KOTKenny
- Full-stack platform for Belarusian university students with academic schedule management, virtual economy, and marketplace
- Designed as a **microservices ecosystem** with dedicated services for schedules, marketplace, store, users, OCR, and notifications communicating via async messaging
- Implemented **event-driven communication** using RabbitMQ — services publish events (OrderPlaced, UserVerified, ScheduleUpdated) consumed by relevant subscribers
- Used **Dapr** for service-to-service invocation, state management (Redis), and pub/sub abstractions over RabbitMQ
- Built **API Gateway** as single entry point routing to internal microservices with auth, rate limiting, and request aggregation
- Each microservice owns its data store (SQL Server / Redis) with **database-per-service** pattern and async eventual consistency via event bus
- Implemented **background workers** for schedule parsing pipeline, escrow release, push notification delivery, and stash queue processing
- Used **Graphify** — AI-powered code knowledge graph tool for dependency analysis and codebase navigation

Education

Electronics Engineer & Programmer
BSUIR, Minsk, 2018-2022
